This packet is **OPTIONAL**. If you complete it, you will earn **BONUS HOMEWORK points**.

You will get 2 bonus points for each section you complete up to a *maximum* of 50 points. In order to receive points for a section, you must:

- Show reasonable, clear work on every problem.
- Turn in your packet by September 1\textsuperscript{st}, 2017.

Each section has a *worked example* and then some problems for you to try. If you are still feeling confused, type the section title into any of these websites:

- khanacademy.org
- ixl.com
- Learnzillion.com

You may also email questions to azern@nhcsb.org

We will *not* be going over the answers to the packets when school begins, but there are answer keys at the school if you want to come check your answers.

You may not have a pencil or pen with you when you check your answers =)
Square Roots

- The square of 5 is 25.
  \[5 \times 5 = 5^2 = 25\]
- The square root of 25 is 5 because \(5^2 = 25\).

\[\sqrt{25} = 5\]

Find each square root. Estimate to the nearest integer if necessary. Use \(\approx\) to show that a value is estimated.

1. \(\sqrt{16}\)  
2. \(\sqrt{85}\)  
3. \(\sqrt{26}\)  
4. \(\sqrt{36}\)

5. \(\sqrt{98}\)  
6. \(\sqrt{40}\)  
7. \(\sqrt{100}\)  
8. \(\sqrt{18}\)

Cube Roots

- The cube of 1 is 1.
  \[1 \times 1 \times 1 = 1^3 = 1\]
- The cube of 3 is 27.
  \[3 \times 3 \times 3 = 3^3 = 27\]
- The cube of 5 is 125.
  \[5 \times 5 \times 5 = 5^3 = 125\]

Find the cube root of each number.

1. 729  
2. 125  
3. 512
The Pythagorean Theorem

The sum of the squares of the lengths of the legs of a right triangle is equal to the square of the length of the hypotenuse.

\[ a^2 + b^2 = c^2 \]

Example 1: Find the length of the hypotenuse.

\[ a^2 + b^2 = c^2 \]
\[ 3^2 + 4^2 = c^2 \]
\[ 9 + 16 = c^2 \]
\[ 25 = c^2 \]
\[ \sqrt{25} = c \]
\[ 5 = c \]

The length \( c \) of the hypotenuse is 5 cm.

Find the length of the hypotenuse of each triangle. If necessary, round to the nearest tenth.

1. \[ \text{10 in.} \]
\[ \text{5 in.} \]

2. \[ \text{8 m} \]
\[ \text{15 m} \]

The lengths of the legs of a right triangle are given. Find the length of the hypotenuse.

3. legs: 6 ft and 8 ft  
   hypotenuse: 

4. legs: 12 cm and 5 cm  
   hypotenuse: 

You can use the Pythagorean Theorem to find the length of a leg in a right triangle.

*Example:* Find the length of the unknown side.

\[ a^2 + b^2 = c^2 \]
\[ 6^2 + b^2 = 10^2 \]
\[ 36 + b^2 = 100 \]
\[ b^2 = 100 - 36 \]
\[ b^2 = 64 \]
\[ b = \sqrt{64} \]
\[ b = 8 \]

The length \( b \) of the unknown leg is 8 cm.

---

**Find the missing leg length. If necessary, round to the nearest tenth.**

1. \[ \begin{array}{c}
   \text{50 ft} \\
   \text{40 ft}
\end{array} \]

---

5. Marcus leans a 12-ft ladder against a wall to clean a window. If the base of the ladder is 3 feet away from the wall, how high up the wall does the ladder reach? If necessary, round to the nearest tenth.
Converse of the Pythagorean Theorem

You can use the Pythagorean Theorem to determine whether a triangle is a right triangle.

\[ a^2 + b^2 \leq c^2 \quad \text{Use the Pythagorean Theorem.} \]
\[ 3^2 + 4^2 \leq 5^2 \quad \text{Substitute 3 for } a, 4 \text{ for } b, \text{ and 5 for } c. \]
\[ 9 + 16 \leq 25 \quad \text{Simplify.} \]
\[ 25 = 25 \]

The equation is true so the triangle is a right triangle.

Determine whether the given lengths can be side lengths of a right triangle.

1. \[ \begin{align*}
6 \text{ in.} & \quad 15 \text{ in.} \\
9 \text{ in.} &
\end{align*} \]

2. \[ \begin{align*}
4.5 \text{ m} & \quad 11.5 \text{ m} \\
2.5 \text{ m} &
\end{align*} \]

3. \[ \begin{align*}
21 \text{ ft} & \quad 29 \text{ ft} \\
20 \text{ ft} &
\end{align*} \]

Solving Two-Step Equations

Follow these steps to solve the two-step equation: \[ 4b + 5 = 17 \]

1. Add or subtract on each side. \[ 4b + 5 - 5 = 17 - 5 \]
\[ 4b = 12 \]

2. Multiply or divide to isolate the variable. \[ \frac{4b}{4} = \frac{12}{4} \]
\[ b = 3 \quad \text{← Each} \]

3. Check by substituting your answer for the variable. \[ \text{Check: } 4b + 5 = 17 \]
\[ 4 \cdot 3 + 5 \leq 17 \]
\[ 17 = 17 \checkmark \]

Solve each equation.

4. \[ \frac{x}{2} + 6 = 4 \]
\[ x = \quad \]

5. \[ 14j - 7 = 91 \]
\[ j = \quad \]

6. \[ 240a - 3 = 5 \]
\[ a = \quad \]
Simplifying Expressions

A term is a number, a variable, or the product of a number and variable(s). The two terms in \(-2x + 4y\) are \(-2x\) and \(4y\).

Terms with exactly the same variable factor are called like terms. In \(-3x + 4y + 5x\), \(-3x\) and \(5x\) are like terms.

One way to combine like terms is by addition or subtraction.

- Add to combine like terms in \(4y + y\).
  \[4y + y = (4 + 1)y = 5y\]
- Subtract to combine like terms in \(2m - 5m\).
  \[2m - 5m = (2 - 5)m = -3m\]

<table>
<thead>
<tr>
<th>Term</th>
<th>Calculation</th>
<th>Simplified</th>
</tr>
</thead>
<tbody>
<tr>
<td>(3a + 5b - a + 2b)</td>
<td>((3a - a) + (5b + 2b))</td>
<td>(2a + 7b)</td>
</tr>
<tr>
<td>(2(x - 4))</td>
<td>(2x - 2(4))</td>
<td>(2x - 8)</td>
</tr>
</tbody>
</table>

Combine like terms.

1. \(6x + 2x = \) ________  
2. \(4c - c = \) ________  
3. \(-h - h = \) ________

Simplify each expression.

10. \(3(m + 4) - 5m = \) ________  
11. \((v - 4)5 = \) ________  
12. \(4a + 2 - 8a + 1 = \) ________  
13. \(6s + 5 - (s - 6) = \) ________
Solving Multi-Step Equations

Combining terms can help solve equations.

Solve: $5n + 6 + 3n = 22$

\[
5n + 3n + 6 = 22 \quad \text{← Commutative Property}
\]

\[
8n + 6 = 22
\]

\[
8n + 6 - 6 = 22 - 6
\]

\[
8n = 16
\]

\[
\frac{8n}{8} = \frac{16}{8}
\]

\[
n = 2
\]

Check: $5n + 6 + 3n = 22$

\[
5(2) + 6 + 3(2) = \checkmark
\]

\[
22 = 22
\]

Sometimes you need to distribute a term in order to simplify.

Solve: $4(x + 2) = 28$

\[
4x + 8 = 28 \quad \text{← Distributive Property}
\]

\[
4x = 20
\]

\[
\frac{4x}{4} = \frac{20}{4}
\]

\[
x = 5
\]

Check: $4(n + 2) = 28$

\[
4(5 + 2) \checkmark
\]

\[
28 = 28
\]

Solve each equation. Check the solution.

1. $a - 4a = 36$

\[
a = \quad \text{b =} \quad \text{n =}
\]

2. $3b - 5 - 2b = 5$

3. $5n + 4 - 8n = -5$

4. $12k + 6 = 10$

5. $3(x - 4) = 15$

6. $y - 8 + 2y = 10$

\[
k = \quad x = \quad y =
\]
Solving Equations with Variables on Both Sides

When an equation has a variable on both sides, add or subtract to get the variable on one side.

\[
\begin{align*}
\text{Solve: } & -6m + 45 = 3m \\
& -6m + 6m + 45 = 3m + 6m \quad \text{Add } 6m \text{ to each side.} \\
& 45 = 9m \\
& \frac{45}{9} = \frac{9m}{9} \\
& 5 = m \\
\text{Check: } & -6m + 45 = 3m \\
& -6(5) + 45 = 3(5) \\
& 15 = 15 \checkmark
\end{align*}
\]

Sometimes you need to distribute a term in order to simplify.

\[
\begin{align*}
\text{Solve: } & 5(x - 3) = 32 - 2 \\
& 5x - 15 = 32 - 2 \quad \text{Distributive Property} \\
& 5x - 15 = 30 \\
& 5x = 45 \\
& \frac{5x}{5} = \frac{45}{5} \\
& x = 9 \\
\text{Check: } & 5(x - 3) = 32 - 2 \\
& 5(9 - 3) = 32 - 2 \\
& 30 = 30 \checkmark
\end{align*}
\]

Solve each equation. Check the solution.

1. \(9j + 35 = 4j\)
   \(j = \) ____________

2. \(13s = 2s - 66\)
   \(s = \) ____________

3. \(2(5t - 4) = 12t\)
   \(t = \) ____________

4. \(6q = 6(4q + 1)\)
   \(q = \) ____________

5. \(7(t - 2) - t = 4\)
   \(t = \) ____________

6. \(6w + 4 = 4w + 1\)
   \(w = \) ____________
## Types of Solutions

If an equation is true for all values of \( x \):

\[
a = a
\]

- **Infinitely many solutions**
  - \( 4x + 8 = 4(x + 2) \)
  - \( 4x + 8 = 4x + 8 \) **Distributive Property**
  - \( 4x + 8 - 4x = 4x + 8 - 4x \) **Subtract**
  - \( 8 = 8 \) **Simplify**

If an equation is true for one value of \( x \):

\[
x = a
\]

- **One solution**
  - \( 5x - 3 = -3x + 5 \)
  - \( 5x - 3 + 3 = -3x + 5 + 3 \) **Add**
  - \( 5x = -3x + 8 \) **Simplify**
  - \( 5x + 3x = -3x + 3x + 8 \) **Add**
  - \( 8x = 8 \) **Divide**
  - \( x = 1 \)

If an equation is not true for any values of \( x \):

\[
a = b
\]

- **No solutions**
  - \( 6x + 2 = 6(x - 1) \)
  - \( 6x + 2 = 6x - 6 \) **Distributive Property**
  - \( 6x - 6x + 2 = 6x - 6x - 6 \) **Subtract**
  - \( 2 = -6 \)

Tell whether each equation has one solution, infinitely many solutions, or no solution.

1. \( 3x - 2 = x + 6 \)
2. \( 5x - 10 = 5(x - 2) \)
3. \( 6x - 1 = 6(x + 2) \)
4. \( 8(x + 2) = 8x + 16 \)
5. \( 2(x - 3) = 2x + 4 \)
6. \( x + 4 = 3(x - 2) \)
Reading Graphs

The graph at the right shows the outside temperature during 16 hours of one day.

- You can see how the temperature changed throughout the day. *The temperature rose 10°F from 4 A.M. to 8 A.M.*  
  *The temperature remained at 60°F for 4 hours, from 12 P.M. to 4 P.M.*

The graph at the right shows a train moving between stations. *The train moves slowly while leaving the station.*  
*Then it picks up speed until it reaches a cruising speed. It slows down as it approaches the next station and gradually comes to a stop.*

- Since the graph is *sketched* to show relationships, the axes do not need number scales. But the axes and the parts of the graph should have labels to show what they represent.

---

The graph at the right shows the altitude of an airplane during a flight. Use the graph for Exercises 1–3.

1. What was the airplane’s altitude for most of the flight?

2. How long did it take the airplane to reach an altitude of 12,000 ft?

3. The third segment in the graph is not as steep as the first segment. What does this mean?
Function Rules

A function describes the relationship between two variables called the input and the output. In a function, each input value has only one output value.

Function: \[ y = 2x + 4 \]

To find output \( y \), substitute values for input \( x \) into the function equation.

For \( x = -10 \):
\[ y = 2(-10) + 4 \]
\[ y = -16 \]

You can also show input/output pairs using function rules.

Function rule:
\[ y = 2x + 4 \]
\[ y = 2(-10) + 4 = -16 \]

Find \( y \) when \( x = 0 \).
\[ y = 2(0) + 4 \]
\[ y = 4 \]

You can list input/output pairs in a table.

<table>
<thead>
<tr>
<th>Input ( x )</th>
<th>Output ( y )</th>
</tr>
</thead>
<tbody>
<tr>
<td>-10</td>
<td>-16</td>
</tr>
<tr>
<td>-5</td>
<td>-6</td>
</tr>
<tr>
<td>0</td>
<td>4</td>
</tr>
<tr>
<td>1</td>
<td>6</td>
</tr>
</tbody>
</table>

Use the function rule \( y = 3x + 1 \). Find each output.

4. \( y \) when \( x = 0 \).
\[ y = 3(\_\_\_) + 1 \]
\[ y = \_\_\_\_\_ \]

5. \( y \) when \( x = 1 \).
\[ y = 3(\_\_\_) + 1 \]
\[ y = \_\_\_\_\_ \]

6. \( y \) when \( x = 5 \).

7. \( y \) when \( x = -6 \).

Proportional Relationships

A proportional relationship is a relationship between inputs and outputs in which the ratio of inputs and outputs is always the same.

<table>
<thead>
<tr>
<th>Gallons of Gas</th>
<th>Cost ($)</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>3</td>
</tr>
<tr>
<td>2</td>
<td>6</td>
</tr>
<tr>
<td>3</td>
<td>9</td>
</tr>
<tr>
<td>4</td>
<td>12</td>
</tr>
</tbody>
</table>

1/3
2/6 = 1/3
3/9 = 1/3
4/12 = 1/3

Write the ratio of each input to its corresponding output.
Then simplify.

The ratios are all the same, so the relationship is proportional.

Determine if the relationship is proportional.

1.

<table>
<thead>
<tr>
<th>( x )</th>
<th>( y )</th>
</tr>
</thead>
<tbody>
<tr>
<td>-3</td>
<td>-9</td>
</tr>
<tr>
<td>-1</td>
<td>-3</td>
</tr>
<tr>
<td>2</td>
<td>6</td>
</tr>
<tr>
<td>4</td>
<td>12</td>
</tr>
</tbody>
</table>

2.

<table>
<thead>
<tr>
<th>( m )</th>
<th>( n )</th>
</tr>
</thead>
<tbody>
<tr>
<td>6</td>
<td>8</td>
</tr>
<tr>
<td>15</td>
<td>20</td>
</tr>
<tr>
<td>24</td>
<td>32</td>
</tr>
<tr>
<td>36</td>
<td>48</td>
</tr>
</tbody>
</table>

---
Linear Functions

A function is linear if the relationship between the changes in variables is constant.

<table>
<thead>
<tr>
<th></th>
<th>1</th>
<th>2</th>
<th>3</th>
<th>5</th>
</tr>
</thead>
<tbody>
<tr>
<td>x</td>
<td>3</td>
<td>6</td>
<td>9</td>
<td>15</td>
</tr>
</tbody>
</table>

\[ \frac{1}{3} \quad \frac{1}{3} \quad \frac{2}{6} = \frac{1}{3} \]

A function is not linear if the relationship between the changes in variables is not constant.

<table>
<thead>
<tr>
<th></th>
<th>2</th>
<th>4</th>
<th>6</th>
<th>8</th>
</tr>
</thead>
<tbody>
<tr>
<td>x</td>
<td>4</td>
<td>6</td>
<td>10</td>
<td>16</td>
</tr>
</tbody>
</table>

\[ \frac{2}{2} = 1 \quad \frac{2}{4} = \frac{1}{2} \quad \frac{2}{6} = \frac{1}{3} \]

Determine if the function represented in the table is linear.

<table>
<thead>
<tr>
<th></th>
<th>-4</th>
<th>-2</th>
<th>1</th>
<th>5</th>
</tr>
</thead>
<tbody>
<tr>
<td>x</td>
<td>-2</td>
<td>0</td>
<td>3</td>
<td>7</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th></th>
<th>-2</th>
<th>-1</th>
<th>1</th>
<th>2</th>
</tr>
</thead>
<tbody>
<tr>
<td>x</td>
<td>7</td>
<td>4</td>
<td>4</td>
<td>7</td>
</tr>
</tbody>
</table>

———

———
Finding Slope

The slope of a line is \( \frac{\text{change in } y}{\text{change in } x} \), found by using two points on the line.

Find the slope of the line that passes through these two points: (4, 3) and (2, -1).

- To find the change in \( y \), subtract one \( y \)-coordinate from the other:
  \( (3 - (-1)) = 4 \).
- To find the change in \( x \), subtract one \( x \)-coordinate from the other:
  \( (4 - 2) = 2 \).

When you find the slope of a line, the \( y \)-coordinate you use first for the rise must belong to the same point as the \( x \)-coordinate you use first for the run.

The slope of the line is:

\[
\frac{\text{change in } y}{\text{change in } x} = \frac{3 - (-1)}{4 - 2} = \frac{4}{2} = 2
\]

Find the slope of each line.

1. [Graph of a line with two points labeled (0, 0) and (2, 4).]
   
   slope = ____________

2. [Graph of a line with two points labeled (0, 0) and (2, 4).]
   
   slope = ____________

3. [Graph of a line with two points labeled (0, 0) and (2, -4).]
   
   slope = ____________

4. [Graph of a line with two points labeled (0, 0) and (2, -4).]
   
   slope = ____________
Finding Slope Continued

Find the slope to compare the rate of change.

Use two values from a table.

<table>
<thead>
<tr>
<th>x</th>
<th>1</th>
<th>2</th>
<th>3</th>
<th>4</th>
</tr>
</thead>
<tbody>
<tr>
<td>y</td>
<td>1</td>
<td>4</td>
<td>7</td>
<td>10</td>
</tr>
</tbody>
</table>

(2, 4) and (4, 10)
slope = \frac{10 - 4}{4 - 2} = \frac{6}{2} = 3

Use the equation \( y = mx + b \).

\[
\begin{align*}
\text{y} & = 2x + 5 \\
\text{y} & = mx + b. \\
\downarrow & \\
\text{The slope is } m, \text{ which is 2.} \\
\text{y} & = 2x + 5
\end{align*}
\]

\( 3 > 2 \), so the function in the table has the greater rate of change.

For Questions 1–4, match each linear function with its rate of change.

1. Austin pays a registration fee of $10 plus $1 for every audiobook he borrows.  
   A. 4

2. 
   \[
   \begin{array}{c|c|c|c|c}
   x & 1 & 3 & 4 & 6 \\
   \hline
   y & 5 & 9 & 11 & 15 \\
   \end{array}
   \]
   B. 3

3. (1, 5), (2, 9)  
   C. 2

4. \( y = 3x - 1 \)  
   D. 1
Graphing Linear Functions

You can graph a function in the coordinate plane. To plot points for the graph, use input as x-values (x-axis) and output as y-values (y-axis).

\[
\begin{align*}
\text{output as y-values} & \quad \text{input as x-values} \\
\downarrow & \quad \downarrow \\
y = 2x + 4 &
\end{align*}
\]

This function has the form of a linear equation and is called a linear function. To draw its graph, use slope and y-intercept:

\[
y = 2x + 4 \\
\text{slope} = 2 \\
y\text{-intercept} = 4
\]

or

plot points from a table and connect them in a line.

\[
\begin{array}{|c|c|}
\hline
x & y \\
\hline
0 & 4 \\
1 & 6 \\
2 & 8 \\
\hline
\end{array}
\]

Graph each linear function.

1. \(y = 3x\)

2. \(y = 2x - 2\)
Writing an Equation of a Line

You can use the graph of a linear function to write its function rule. First, you need to find the slope and the y-intercept.

1. From the graph, the slope \( m \) is \(-\frac{1}{2}\).
2. The point \((0, 3)\) is on the graph so the y-intercept \( b \) is 3.
3. Substitute in the slope-intercept form.
   \[
   y = mx + b
   \]
   \[
   y = -\frac{1}{2}x + 3
   \]
   The function rule is \( y = -\frac{1}{2}x + 3 \).

Identify the slope and y-intercept of each graph. Then write a linear equation.

3. 

4. 

---

---
Solving Systems of Equations by Substitution

You can solve systems of equations by substitution.

\[-2x + 4y = 2\]
\[x + y = 8\]

**Step 1**

Solve one of the equations for one of the variables.

\[x + y = 8\] ← Write the second equation.
\[y = -x + 8\] ← Subtract \(x\) from both sides.

**Step 2**

Substitute \(-x + 8\) for \(y\) in the other equation.

\[-2x + 4y = 2\] ← Write the first equation.
\[-2x + 4(-x + 8) = 2\] ← Substitute \(-x + 8\) for \(y\).
\[-2x - 4x + 32 = 2\] ← Use the Distributive Property.
\[-6x + 32 = 2\] ← Simplify.
\[-6x = -30\] ← Subtract 32 from each side.
\[x = 5\] ← Divide each side by \(-6\).

**Step 3**

Substitute 5 for \(x\) in either equation and solve for \(y\).

\[x + y = 8\] ← Write either equation.
\[5 + y = 8\] ← Substitute 5 for \(x\).
\[y = 3\] ← Subtract 5 from both sides.
The solution is \((5, 3)\).

---

Solve each system by substitution. Check your answer.

1. \[y = -x + 1\]
   \[-2x - y = 2\]
2. \[2x + y = 6\]
   \[6x - y = 2\]
Solving Systems of Equations by Elimination

You can solve some systems of equations by adding.

**Step 1:** Eliminate one variable.

\[
\begin{align*}
2x + 3y &= 12 \\
x - 3y &= -3 \\
\underline{3x + 0 = 9} &\quad \leftarrow \text{Add} \\
x &= 3 &\quad \leftarrow \text{Solve for } x.
\end{align*}
\]

**Step 2:** Substitute the value you found into one equation.

\[
\begin{align*}
2x + 3y &= 12 &\quad \leftarrow \text{Write either equation.} \\
2(3) + 3y &= 12 &\quad \leftarrow \text{Substitute 3 for } x. \\
6 + 3y &= 12 &\quad \leftarrow \text{Simplify.} \\
3y &= 6 &\quad \leftarrow \text{Divide by 3.} \\
y &= 2 &\quad \leftarrow \text{Solve for } y.
\end{align*}
\]

The solution is \((3, 2)\).

---

**Solve each system of equations by elimination. Check your solution.**

1. \[
\begin{align*}
x + y &= 9 \\
x - y &= 1
\end{align*}
\]

2. \[
\begin{align*}
3x + 2y &= 2 \\
x - 2y &= 6
\end{align*}
\]
Scientific Notation

To write a number such as 67,000 in scientific notation, move the decimal point to form a number between 1 and 10. The number of places moved shows which power of 10 to use.

- Write 67,000 in scientific notation.
  
  6.7 is between 1 and 10. So, move the decimal point in 67,000 to the left 4 places and multiply by 10⁴.
  
  67,000 = 6.7 \times 10^4

To write scientific notation in standard form, look at the exponent. The exponent shows the number of places and the direction to move the decimal point.

- Write $8.5 \times 10^5$ in standard form.
  
  The exponent is positive 5, so move the decimal point 5 places to the right.
  
  $8.5 \times 10^5 = 850,000$

Write each number in scientific notation.

1. 6,500
2. 65,000
3. 6,520

Write each number in standard form.

10. $4 \times 10^4$
11. $4 \times 10^5$

Multiplying Exponents

- To multiply numbers or variables with the same base, add the exponents.

  Simplify $3^2 \cdot 3^4$
  
  $3^2 \cdot 3^4 = 3^{(2+4)}$
  
  $= 3^6$

  Simplify $n^3 \cdot n^4$
  
  $n^3 \cdot n^4 = n^{(3+4)}$
  
  $= n^7$

  Simplify $(-4)^3 \cdot (-4)^5$
  
  $(-4)^3 \cdot (-4)^5 = (-4)^{(3+5)}$
  
  $= (-4)^8$

- You can also simplify expressions with exponents.

  $6x^2 \cdot -2x^5 = 6 \cdot -2 \cdot x^{2 \cdot 5}$
  
  $= -12x^{(2+5)}$
  
  Use the Commutative Property of Multiplication
  
  $= -12x^7$
  
  Add the exponents.
  
  $= -12x^7$
  
  Simplify.

Write each expression using a single exponent.

1. $5^3 \cdot 5^4$
2. $a^2 \cdot a^5$
3. $(-8)^4 \cdot (-8)^5$

Find each product. Write the answer in scientific notation.

10. $2x^3 \cdot x^2$
11. $-4x^3 \cdot 2x^4$
Multiplying Scientific Notation

- To multiply numbers in scientific notation.

Find the product \((5 \times 10^3)(7 \times 10^5)\). Write the result in scientific notation.

\[(5 \times 10^3)(7 \times 10^5)\]

\[(5 \cdot 7)(10^4 \cdot 10^5)\] ← Use the Associative and Commutative properties.

\[35 \times (10^4 \cdot 10^5)\] ← Multiply 5 and 7.

\[35 \times 10^4 + 5\] ← Add the exponents for the powers of 10.

\[35 \times 10^9\]

\[3.5 \times 10^1 \times 10^9\] ← Write 35 in scientific notation.

\[3.5 \times 10^{10}\] ← Add the exponents.

---

Find each product. Write the answer in scientific notation.

1. \((3 \times 10^4)(5 \times 10^3)\)

2. \((2 \times 10^5)(7 \times 10^6)\)

3. \((8 \times 10^2)(5 \times 10^2)\)

4. \((9 \times 10^6)(7 \times 10^8)\)
Dividing Exponents

To divide powers with the same base, subtract exponents.

\[
\frac{8^6}{8^4} = 8^{6-4} \quad \frac{a^5}{a^3} = a^{5-3} \\
= 8^2 \quad = a^2 \\
= 64
\]

- For any nonzero number \(a\), \(a^0 = 1\).
  
  \[3^0 = 1 \quad (-6)^0 = 1 \quad 4x^0 = 4(1) = 4\]

- For any nonzero number \(a\) and any integer \(n\), \(a^{-n} = \frac{1}{a^n}\).

\[
2^{-4} = \frac{1}{2^4} \quad 3c^{-2} = \frac{3}{c^2} \quad \frac{5^3}{5^6} = 5^{3-6} \quad \frac{10z^{-3}}{5z} = 2z^{5-1} \\
= \frac{1}{16} \quad = \frac{3}{c^2} \quad = 5^{-3} \quad = 2z^2 \\
= \frac{1}{5^3} \quad = \frac{1}{125}
\]

Simplify each expression.

1. \(\frac{5^5}{6^3} = \) ________ 
2. \((-4)^5 + (-4)^3 = \) ________ 
3. \((-3)^{-2} = \) ________

4. \(\frac{2^5}{2^7} = \) ________ 
5. \((-8)^0 = \) ________ 
6. \(\frac{5^0}{5^2} = \) ________

Simplify each expression. Write your answer using only positive exponents.

10. \(w^0 \div w^3 = \) ________ 
11. \(x^5 \div x^1 = \) ________ 
12. \(\frac{d^7}{d^3} = \) ________
Angles

- **Vertical angles** are pairs of opposite angles formed by two intersecting lines. They are congruent.

  Example 1: \(\angle 1\) and \(\angle 3\), \(\angle 4\) and \(\angle 2\)

- **Adjacent angles** have a common vertex and a common side, but no common interior points.

  Example 2: \(\angle 1\) and \(\angle 2\), \(\angle 1\) and \(\angle 4\)

- **Two supplementary angles** form a 180° angle.

  Example 3: \(\angle 1\) and \(\angle 4\) are supplementary angles. \(\angle 3\) is also a supplement of \(\angle 4\).

  If you know the measure of one supplementary angle, you can find the measure of the other.

  \[ \text{If } m\angle 4 \text{ is } 120^\circ, \quad \text{then } m\angle 1 = 180^\circ - 120^\circ, \text{ or } 60^\circ. \]

- **Two complementary angles** form a 90° angle.

  Example 4: \(\angle 5\) and \(\angle 6\) are complementary angles. \(\angle 6\) is a complement of \(\angle 5\).

  If you know the measure of one complementary angle, you can find the measure of the other.

  \[ \text{If } m\angle 5 \text{ is } 30^\circ, \quad \text{then } m\angle 6 = 90^\circ - 30^\circ, \text{ or } 60^\circ. \]

---

**Use the diagrams at the right for Exercises 1–5.**

1. Vertical angles: \(\angle 7\) and ________________
2. Adjacent angles: \(\angle 10\) and ________________
3. Supplementary angles: \(\angle 8\) and ________________
4. Complementary angles: \(\angle 12\) and ________________
5. Vertical angles: \(\angle 8\) and ________________

---

**Find the measure of the supplement of each angle.**

6. 38°
7. 65°

---

**Find the measure of the complement of each angle.**

9. 25°
10. 18°
Parallel Lines and Angles

Look at the figure at the right.

- Line $\overrightarrow{AB}$ is parallel to line $\overrightarrow{CD}$ ($\overrightarrow{AB} \parallel \overrightarrow{CD}$).
- Line $\overrightarrow{EF}$ is a transversal.

Alternate interior angles lie within a pair of lines and on opposite sides of the transversal.

Example 1: $\angle 3$ and $\angle 5$, $\angle 4$ and $\angle 6$

Alternate interior angles are congruent. If $m\angle 4$ is $60^\circ$, then $m\angle 6$ is also $60^\circ$.

Corresponding angles lie on the same side of the transversal and in corresponding positions.

Example 2: $\angle 1$ and $\angle 5$, $\angle 3$ and $\angle 7$

Corresponding angles are congruent. If $m\angle 1$ is $120^\circ$, then $m\angle 5$ is also $120^\circ$.

Use the diagram at the right to complete Exercises 1–2.

1. Name the alternate interior angles.
   a. $\angle 11$ and $\angle $?
   b. $\angle 12$ and $\angle $?

2. Name the corresponding angles.
   a. $\angle 16$ and $\angle $?
   b. $\angle 14$ and $\angle $?
   c. $\angle 9$ and $\angle $?
   d. $\angle 11$ and $\angle $?

In the diagram at the right, $\ell \parallel m$. Find the measure of each angle.

3. $\angle 1$

4. $\angle 3$

5. $\angle 6$

6. $\angle 5$
Congruence statements reveal corresponding parts.

**Example 1:** \( \overline{AB} \) corresponds to \( \overline{DE} \).
\( \angle C \) corresponds to \( \angle F \).

Corresponding parts are congruent (\( \cong \)).

**Example 2:** \( \overline{AB} \cong \overline{DE} \)
\( \angle C \cong \angle F \)

---

In the diagram at the right, \( ABCD \cong JKLM \).

**Complete the following.**

1. \( \angle A \cong \) __________
2. \( \overline{KL} \cong \) __________
3. \( \angle M \cong \) __________
4. \( \overline{DC} \cong \) __________

---

**Similarity**

Similar polygons have congruent corresponding angles and corresponding sides that are in proportion.

The symbol \( \sim \) means *is similar to*.

**Example:** Is parallelogram \( ABCD \sim \) parallelogram \( KLMN \)?

1. **Check corresponding angles.** \( \angle A \cong \angle K, \angle B \cong \angle L, \angle C \cong \angle M, \) and \( \angle D \cong \angle N \)

2. **Compare corresponding sides.**
\[
\begin{align*}
\frac{AB}{KL} &= \frac{8}{4} = 2 \\
\frac{BC}{LM} &= \frac{12}{6} = 2 \\
\frac{CD}{MN} &= \frac{8}{4} = 2 \\
\frac{DA}{NK} &= \frac{12}{6} = 2
\end{align*}
\]

---

**Tell whether each pair of polygons is similar. Explain why or why not.**

1. \[
\begin{align*}
&4 \quad 4 \\
&6 \quad 6
\end{align*}
\]

2. \[
\begin{align*}
&12 \quad 40^\circ \\
&9 \quad 50^\circ \\
&15 \quad 45^\circ \\
&6 \quad 7.5
\end{align*}
\]

3. \[
\begin{align*}
&12 \quad 40^\circ \\
&6 \quad 50^\circ \\
&4.5 \quad 7.5
\end{align*}
\]
Angles in Triangles

The angles of a triangle add to 180°.

You can use the angle sum to find a missing angle measure.

\[
m\angle Q + m\angle R + m\angle S = 180°
\]

\[
46° + m\angle R + 46° = 180°
\]

\[
92° + m\angle R = 180°
\]

\[
92° - 92° + m\angle R = 180° - 92°
\]

\[
m\angle R = 88°
\]

Determine the unknown angle measure in each triangle.

1.

\[

\]

\[
40°
\]

\[
X
\]

\[
53°
\]

\[
Z
\]

2.

\[
Q
\]

\[
64°
\]

\[
P
\]

\[
72°
\]

\[
R
\]
Translations

A translation moves every point of a figure the same distance in the same direction.

Triangle $ABC$ is translated 5 units to the right and 4 units up. The image of $\triangle ABC$ is $\triangle A'B'C'$.

You can write a rule to describe a translation in the coordinate plane.

To get the translation of $\triangle DEF$, you have to add 5 to each $x$-coordinate and add 1 to each $y$-coordinate.

$D(-4, -1) \rightarrow D'(1, 0)$

$E(-6, -2) \rightarrow E'(-1, -1)$

$F(-6, -5) \rightarrow F'(-1, -4)$

$(x, y) \rightarrow (x + 5, y + 1)$

Copy each figure. Then graph the image after the given translation. Name the coordinates of the image.

1. right 5 units, up 1 unit

2. left 3 units, down 2 units

Use arrow notation to write a rule that describes the translation shown on each graph.

3.

4.
Transformations and Congruence

You can use transformations to determine congruence.

Determine whether the two triangles are congruent. If so, write a congruence statement.

Sample method:
The triangles are on opposite sides of the x-axis. Start by reflecting \( \triangle LMN \) over the x-axis to get \( \triangle L'M'N' \).

\( \triangle L'M'N' \) and \( \triangle XYZ \) are on opposite sides of the y-axis. Reflect \( \triangle L'M'N' \) over the x-axis to get \( \triangle XYZ \).

A reflection over the x-axis followed by a reflection over the y-axis maps \( \triangle LMN \) onto \( \triangle XYZ \). So \( \triangle LMN \equiv \triangle XYZ \).

Determine which triangles, if any, are congruent to \( \triangle ABC \).

1. \( \triangle PQR \) Yes \( \bigcirc \) No \( \bigcirc \)

2. \( \triangle XYZ \) Yes \( \bigcirc \) No \( \bigcirc \)

3. \( \triangle PQR \) Yes \( \bigcirc \) No \( \bigcirc \)
Volume of Prisms and Cylinders

To find the volume of a prism or a cylinder, multiply the base area $B$ and the height $h$.

<table>
<thead>
<tr>
<th>Step</th>
<th>Expression</th>
<th>Calculation</th>
<th>Result</th>

</tr>
<tr>
<td></td>
<td></td>
<td>The volume is $120$ yd$^3$.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>$B = \pi r^2$</td>
<td>$\pi \cdot 3^2$</td>
<td>$28.26$ yd$^2$</td>
</tr>
<tr>
<td></td>
<td></td>
<td>$\approx 28.26$ yd$^2$</td>
<td>$V = Bh$</td>
</tr>
<tr>
<td></td>
<td></td>
<td>$\approx 28.26 \text{ yd}^2 \times 10$</td>
<td>$282.6$ yd$^3$</td>
</tr>
</tbody>
</table>
|      |            | The volume is about $283$ yd$^3$. |}

Find the base area and volume of each prism.

1. 
   
   $B =$ 
   
   $V =$

2. 
   
   $B =$ 
   
   $V =$

Find the base area of each cylinder to the nearest hundredth. Then find the volume of each cylinder to the nearest cubic unit.

4. 
   
   $B \approx$ 
   
   $V \approx$

5. 
   
   $B \approx$ 
   
   $V \approx$
Volume of Cones and Pyramids

To find the volume of a pyramid or cone, multiply \( \frac{1}{3} \), the base area \( B \), and the height \( h \).

<table>
<thead>
<tr>
<th></th>
<th>Find the base area ( B ).</th>
<th>Multiply ( \frac{1}{3} ), the base area ( B ), and the height ( h ).</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>( B = lw )</td>
<td>( V = \frac{1}{3}Bh )</td>
</tr>
<tr>
<td></td>
<td>( = 6 \cdot 4 )</td>
<td>( = \frac{1}{3}(24)(9) )</td>
</tr>
<tr>
<td></td>
<td>( = 24 \text{ cm}^2 )</td>
<td>( = 72 \text{ cm}^3 )</td>
</tr>
<tr>
<td></td>
<td></td>
<td>The volume is 72 cm(^3).</td>
</tr>
</tbody>
</table>

\( B = \pi r^2 \)

\( \approx \frac{1}{3}(28.26)(12) \)

\( \approx 113.04 \text{ cm}^3 \)

The volume is about 113 cm\(^3\).

---

Find the volume of each figure to the nearest whole cubic unit.

1. 
   ![Diagram of a cone with dimensions 12 cm and 5 cm]
   
   \( V = \frac{1}{3} \times 12 \times 5 \times 12 \approx 224 \text{ cm}^3 \)

2. 
   ![Diagram of a cone with dimensions 16 cm and 10 cm]
   
   \( V = \frac{1}{3} \times 16 \times 60 \approx 333 \text{ cm}^3 \)

3. 
   ![Diagram of a pyramid with dimensions 8 m, 12 m, and 12 m]
   
   \( V = \frac{1}{3} \times 8 \times 6 \times 12 \approx 384 \text{ m}^3 \)

4. 
   ![Diagram of a pyramid with dimensions 4 cm, 5.8 cm, and 6.3 cm]
   
   \( V = \frac{1}{3} \times 4 \times 29 \times 19 \approx 367 \text{ cm}^3 \)
Spheres

Find the surface area and volume of a beach ball with a radius of 8 inches.

The surface area of a sphere is four times the product of $\pi$ and the square of the radius $r$.

\[
\text{S.A.} = 4\pi r^2 \quad \text{Surface area of a sphere}
\]
\[
= 4\pi(8^2) \quad \text{Substitute.}
\]
\[
= 256\pi \quad \text{Simplify.}
\]
\[
\approx 804 \quad \text{Use a calculator.}
\]

The surface area of the beach ball is about 804 in.$^2$.

The volume of a sphere is four-thirds of the product of $\pi$ and the radius $r$ cubed.

\[
V = \frac{4}{3}\pi r^3 \quad \text{Volume of a sphere}
\]
\[
= \frac{4}{3}\pi(8^3) \quad \text{Substitute.}
\]
\[
= \frac{2,048}{3}\pi \quad \text{Simplify.}
\]
\[
\approx 2,145 \quad \text{Use a calculator.}
\]

The volume of the beach ball is about 2.145 in.$^3$.

---

A glass blower sells opalescent glass spheres. Find the surface area and volume of each sphere to the nearest whole number.

1. blue: $r = 2$ in.

2. green: $d = 9$ cm
Scatter Plots

You can make a scatterplot to show data.

<table>
<thead>
<tr>
<th>Elevation (m)</th>
<th>500</th>
<th>1000</th>
<th>1000</th>
<th>1500</th>
<th>1500</th>
<th>2000</th>
<th>2000</th>

</thead>
<tbody>
<tr>
<td>Temperature (°C)</td>
<td>18</td>
<td>14</td>
<td>12</td>
<td>11</td>
<td>10</td>
<td>8</td>
<td>6</td>
</tr>
</tbody>
</table>

**Step 1** Use the horizontal axis to represent elevation. The elevation ranges from 500 to 2,000. A reasonable scale is 0 to 2,000 where each grid line increases by 500.

**Step 2** Use the vertical axis to represent the temperature. The temperature ranges from 18°C to 6°C. A reasonable scale is 0 to 20 where each grid line increases by 2°C.

**Step 3** Plot the data. For example, at an elevation of 500 m, the temperature is 18°C. Plot (500, 18).

1. What information is shown on the horizontal axis of the scatter plot?

2. What information is shown on the vertical axis of the scatter plot?

3. What does the highlighted point represent?

4. How many hours did she have to babysit to earn $22?
Linear Models

A trend line is a line you draw on a graph to approximate the relationship between data sets.

- To find the trend line, first plot the data.
- Then look for a trend. Draw a line that has a slope with the same trend.
- Make sure there are about as many points above the line as below it.
- You can use two points on the trend line to calculate its slope. Then you can use the slope and estimate the y-intercept to write an equation to describe the line.
- You can use a trend line equation to estimate values and make predictions.

<table>
<thead>
